Deliverable

Prepared for openETCS@ITEA2 Project

OETCS/WP4/D4.1V00.02

Abstract: This document describes strategy and plan of the verification and validation activities in the project openETCS. As the goals of the project include the selection, adaption and construction of methods and tools for a FLOSS development in addition to performing actual development steps, differing from the plan for a full development project, the plan covers also activities evaluating the suitability of methods and tools, and it makes provisions for incorporation of V&V of partial developments which are actually done.

The overall strategy is to support the design process as specified in D2.3 and its partial instantiations within openETCS. In accordance with the project approach, V&V shall be done in a FLOSS style, and it has to suit a model-based development. A further main consideration shall be to strive for conformance with the requirements of the standards (EN 50128 and further). This means that the contribution of all activities to a complete verification and validation shall be defined and assessed.

The plan details how to perform verification & validation for a complete development which follows the process sketch from D2.3, so that the result conforms to the requirements of the standards for a SIL 4 development. This includes a definition of activities, the documentation to be produced, the organisation structure, roles, a selection of methods and tools, a format for describing design artifacts subject to V&V, and a feedback format for the findings during V&V.

As D2.3 gives only a rough description of the development steps and not yet a complete list of design artifacts, nor one of methods applied and formats to be used, this first version of the V&V plan will also lack detail which will to be added in later revisions as these informations become more concrete.

Besides the usual purpose of verification & validation activities, namely evaluating and proving the suitability of design artifacts, V&V in openETCS will also generate information on the suitability of the methods and tools employed. For that purpose, a format for describing methods and tools to be used in V&V and one for summarizing the findings about the suitability are defined.

The plan also contains partial instantiations of V&V which match partial developments that are realised within openETCS.

Introduction

0.1 Purpose

The purpose of this document is to define the verification & validation activities in the project openETCS.

This document describes strategy and plan of the verification and validation activities in the project openETCS. As the goals of the project include the selection, adaption and construction of methods and tools for a FLOSS development in addition to performing actual development steps, differing from the plan for a full development project, the plan covers also activities evaluating the suitability of methods and tools, and it makes provisions for incorporation of V&V of partial developments which are actually done.

- **WP4-T1-G:** A useful plan for WP 4, that is, one that defines a way to achieve the goals of WP 4:
 - **WP4-G1:** Identify and demonstrate methods and tools to handle the V&V of a FLOSS development of the EVC software
 - WP4-G2: Perform as much of V&V on the DAS2Vs produced in the project as possible

Detailed Goals and Means

- **WP4-T1-G1:** The plan shall give an overview of and a structure to the things required from V&V for an openETCS (FLOSS-) development.
 - **WP4-T1-M1:** Identifies all (most) of the activities which have to be made for a full development according to the standards, in a form relevant to the approach of openETCS (FLOSS, participants). This may include alternatives.
- **WP4-T1-G2:** The plan shall provide a framework into which the V&V activities which will be performed within the project do fit.
 - **WP4-T1-M2-1:** Design formats for collecting information about DAS2Vs (V&V tasks), about the results of V&V activities, about activities of V&V method and tool development, about the results of evaluations of V&V methods and tools. Sketch how all of the information is to be gathered and finally incorporated into the final V&V report (D4.4).
 - **WP4-T1-M2-2:** Identify potential variants of partial implementations of V&V processes which are likely going to be performed within the project. These may be (?should be?) related to design activities within the project which produce DAS2Vs.
- WP4-T1-G3: The plan shall delineate means for V&V within openETCS
 - **WP4-T1-M3-1:** A partial V&V process (see WP4-T1-M2 above) consists of a set of related DASVs and V&V steps to be applied to them. A V&V step is described by input and output (result, purpose) with V&V methods and means.

OETCS/WP4/D4.1V00.02 vii

WP4-T1-M3-2: The plan will prepare the selection of adequate methods and means (tools) by providing evaluation criteria and incorporating available evaluation results.

WP4-T1-M3-2-1: Definition of an evaluation format for tools and methods.

WP4-T1-G4: The plan shall incorporate currently available information on openETCS development process and means and be amendable to future changes and additions.

WP4-T1-M4-1: Use D2.3 in instantiating the general requirements laid down in the standards.

WP4-T1-M4-2: Use D2.1 for tools.

WP4-T1-M4-3: Identify open points and include delineations for things which are useful for a complete V&V but not yet planned or detailed by project activities already performed.

This document describes which verification and validation activities are needed for a full FLOSS development of the EVC software. It describes how the work performed within the project openETCS is to be organised to contribute to such a task, and how to demonstrate that it can be realised.

The document is only valid in conjunction with the Quality Assurance plan [1104G13-QA-plan]

0.2 Plan for Completing this Document

Terminology

DAS2V: Design Artifact Subject to Verification or Validation

G: Goal

M: Means

F: Finding/Result/Action

Detailed Goals and Means

WP4-T1-G1: The plan shall give an overview of and a structure to the things required from V&V for an openETCS (FLOSS-) development.

WP4-T1-M1: Identifies all (most) of the activities which have to be made for a full development according to the standards, in a form relevant to the approach of openETCS (FLOSS, participants). This may include alternatives.

WP4-T1-G2: The plan shall provide a framework into which the V&V activities which will be performed within the project do fit.

WP4-T1-M2-1: Design formats for collecting information about DAS2Vs (V&V tasks), about the results of V&V activities, about activities of V&V method and tool development, about the results of evaluations of V&V methods and tools. Sketch how all of the information is to be gathered and finally incorporated into the final V&V report (D4.4).

WP4-T1-M2-2: Identify potential variants of partial implementations of V&V processes which are likely going to be performed within the project. These may be (?should be?) related to design activities within the project which produce DAS2Vs.

OETCS/WP4/D4.1V00.02 viii

- **WP4-T1-G3:** The plan shall delineate means for V&V within openETCS
 - **WP4-T1-M3-1:** A partial V&V process (see WP4-T1-M2 above) consists of a set of related DASVs and V&V steps to be applied to them. A V&V step is described by input and output (result, purpose) with V&V methods and means.
 - **WP4-T1-M3-2:** The plan will prepare the selection of adequate methods and means (tools) by providing evaluation criteria and incorporating available evaluation results.
 - **WP4-T1-M3-2-1:** *Definition of an evaluation format for tools and methods.*
- **WP4-T1-G4:** The plan shall incorporate currently available information on openETCS development process and means and be amendable to future changes and additions.
 - **WP4-T1-M4-1:** Use D2.3 in instantiating the general requirements laid down in the standards.
 - **WP4-T1-M4-2:** *Use D2.1 for tools.*
 - **WP4-T1-M4-3:** *Identify open points and include delineations for things which are useful for a complete V&V but not yet planned or detailed by project activities already performed.*

Concrete First Steps (in SCRUM terminology: the backlog)

- **WP4-T1-S1:** Assess the input material
 - **WP4-T1-S1-1:** Assess sketch of the V&V plan (partly done)
 - **WP4-T1-F1-1-1:** *The current format is .doc*
 - **WP4-T1-F1-1-2:** The plan currently lists mainly the requirements on the plan and does not yet detail much of the plan itself.

WP4-T1-F1-1-3:

- **WP4-T1-S1-2:** Assess D2.3 "Process Definition" with definition of DAS2Vs and V&V steps
 - **WP4-T1-F1-2-1:** DAS2Vs and verification & validation steps defined on a high level
- **WP4-T1-S1-3:** Assess D2.9 "Requirements for Verification & Validation"
 - **WP4-T1-F1-3-1:** very high-level, requirements included in the appendix for reference in further completion in relevant for future steps
- **WP4-T1-S1-4:** Assess D2.1 ("Report on Existing Methodologies")
 - **WP4-T1-F1-4-1:** *Seems very sketchy*
- **WP4-T1-S1-5:** Assess development and V&V activities planned or already on the way for taking them into account in the V&V plan
 - **WP4-T1-S1-5-1:** *Ask a lot of people (or the right people)*
 - **WP4-T1-S1-5-1-1:** Design a query email (to be backed up by phone or personal inquiries)
- **WP4-T1-S2:** *Organize the writing*
 - **WP4-T1-S2-1:** *Make a detailed work plan*
 - **WP4-T1-S2-1-1:** *Transform the sketch to .tex*
 - **WP4-T1-S2-1-2:** Revise the structure according to what is expected to be done accommodating the info on the process (D2.3 -WP4-T1-S1-2) and on ongoing activities (WP4-T1-S1-5).
 - **WP4-T1-S2-1-3:** References to the requirements (D2.9 WP4-T1-S1-3) are to be included

OETCS/WP4/D4.1V00.02 ix

WP4-T1-S2-1-4: Tools and methods

WP4-T1-S2-1-4-1: Format for evaluation (formulate evaluation criteria, D4.1a)

WP4-T1-S2-1-5: Result collection

WP4-T1-S2-1-5-1: *Sketch all the formats (purpose)*

WP4-T1-S2-1-5-2: *Sketch the process of information collection (T4.2 and T4.3 will have to do that)*

WP4-T1-S2-1-6: Include section on V&V plan revision

WP4-T1-S2-2: Find contributors
WP4-T1-S2-3: Distribute the work

WP4-T1-S3: Do the work

0.3 Background Information

%%Further Info, perhaps put the project context here %%

0.3.1 Definitions

Verification

Verification is an activity which has to be performed at each step of the design. It has to be verified that the design step achieved its goals. This consists at least of two parts:

- that the artifacts produced in the step are of the right type and contain allthe information they should. E.g., that the SSRS identifies all components addressed in SS 026, specifies their interfaces in sufficient detail and has allocated the functions to the components (this should just serve an example and is based on a guess what the SSRS should do)
- that the artifact correctly implements the input requirements of the design step. These typically include the main output artifacts of the previous step. "Correctly implements" includes requirement coverage (tracing). This can and should be supported by some tools. Adequacy of such tools depends on things like format compatibility, degree of automation, functionality (e.g., ability to handle m-to-n relations). Depending on the design step (and the nature of the artifacts) different forms of verification will complement requirement coverage, with different levels of support. The step from SS 026 to the SSRS will mainly consist of manual activities besides things like coverage checks. Verifying a formal (executable) model against the SSRS can be supported by animation or simulation to e.g. execute test cases which have been designed to check compliance with the SSRS. Even formal proof tools may be employed to check or establish properties. Model-to-code steps offer far more options (and needs) for tool support. And tools or tool sets for unit test will support dynamic testing for requirement or code coverage. This may include test generation, test execution with report generation, test result evaluation and so on. Also, code generator verification (or qualification) may play a role, here. Integration steps mandate still other testing (or verification) techniques.

Summarizing, one may say that verification subsumes highly diverse activities, and may be realized in very many different forms.

OETCS/WP4/D4.1V00.02

Validation

Validation is name for the activity by which the compliance of the end result with the initial requirements is shown. In the case of openETCS, this means that the demonstrator (or parts of it) are checked against the SS 026 or one of its close descendants (i.e., SSRS). This will consist of testing the equipment according to a test plan derived form the requirements and detailed into concrete test cases at some later stage. Tool support for validation will thus mainly concern test execution and evaluation, perhaps supplemented by test derivation or test management. Ambitous techniques like formal proof are most likely not applicable here.

Thus, the tool support for validation will not differ substantially from that for similar verification activities.

One might also consider "early" validation activities, e.g. "validating" an executable model against requirements from the SS 026. These are not mandated by the standards and can per se not replace design step verification. They may nevertheless be worthwhile as means for early defect detection.

Further (mostly complementary) information on V&V can be found in the report on the CEN-ELEC standards (D2.2). OETCS/WP4/D4.1V00.02 xi

Verification & Validation Strategy

The overall strategy is to support the design process as specified in D2.3 and its partial instantiations within openETCS. In accordance with the project approach, V&V shall be done in a FLOSS style, and it has to suit a model-based development. A further main consideration shall be to strive for conformance with the requirements of the standards (EN 50128 and further). This means that the contribution of all activities to a complete verification and validation shall be defined and assessed.

0.4 Verification & Validation Strategy for a Full Development

Define the strategy for a full EVC software development.

0.5 Verification & Validation Strategy for openETCS

The project will only perform part of the development, and thus also only a part of the V&V activities. Define how the project demonstrates that a full development would be possible.

OETCS/WP4/D4.1V00.02 xii

Verification & Validation Plan for a Full Development

%%detail%%

Instantiate the generic Verification & Validation plan from the standard (and the draft) to openETCS. That is, provide the requirements, define the design steps, identify verification & validation activities to be performed and documents to be produced.

The plan details how to perform verification & validation for a complete development which follows the process sketch from D2.3, so that the result conforms to the requirements of the standards for a SIL 4 development. This includes a definition of activities, the documentation to be produced, the organisation structure, roles, a selection of methods and tools, a format for describing design artifacts subject to V&V, and a feedback format for the findings during V&V.

As D2.3 gives only a rough description of the development steps and not yet a complete list of design artifacts, nor one of methods applied and formats to be used, this first version of the V&V plan will also lack detail which will to be added in later revisions as these informations become more concrete.

Besides the usual purpose of verification & validation activities, namely evaluating and proving the suitability of design artifacts, V&V in openETCS will also generate information on the suitability of the methods and tools employed. For that purpose, a format for describing methods and tools to be used in V&V and one for summarizing the findings about the suitability are defined.

The plan also contains partial instantiations of V&V which match partial developments that are realised within openETCS.

0.6 Plan Overview

0.7 Requirements Base

The requirements on the EVC software origin in the SS-026 and TSI specifications.

%%detail this, add references%%

0.8 Verification of the SSRS (Process Step 1c)

0.8.1 Definition of the Object of Verification

The SSRS (sub-system requiement specification) outlines the subsystem which is going to be modeled within the project. The SSRS describes the architecture of the subsystem (functions and their I/O) and the requirements allocated to these functions. If necessary, the requirements are rewritten in order to address the I/O and to correspond to the allocation. It also provides the

OETCS/WP4/D4.1V00.02 xiii

classification into vital and non vital requirements and data streams. The architecture part is described in a semi-formal language, and the requirements are described in natural language.

The SSRS is to be viewed as a supplement to the SS-026 and the TSIs and is not intended to replace them. The verification has to check that a complete and consistent set of functionalities have been identified and that the architecture is adequate. Due to the informal nature of the SSRS, mainly manual techniques are to be applied.

%% Verifiy hazard analysis too?%%

0.9 Verification of the Subsystem Model (Process Step 2a)

%%add detail%%

0.10 Structure of the Verification & Validation Report

The verification and validation plan covers the following central topics:

Header containing all information to identify, this report, the authors, the approbation and reviewing entities.

Executive Summary giving an overview of the major elements from all sections.

- **Problem Statement** describing the challenges to be answered by Verification & Validation as well as the decisions to be taken based on the V&V results as well as how to cope with potentially faulty output. It further describes the accreditation scope based on the risk assessment done on V&V-level.
- **V&V Requirements Traceability Matrix** links every V&V artifact back to the requirements to measure e.g. test coverage and to directly link V&V results to the requirements.
- Acceptability Criteria, describing the criteria for acceptance of the artifact into the Verification & Validation process e.g. as the direct translation of the requirements into metrics to measure success, are used e.g. for burndown charts within the process.
- **Assumptions** that are identified during the design of the verification and validation strategy and how these assumptions have an impact on the verdict by listing capabilities and limitations.
- **Risks and Impacts** that come across the execution of V&V tasks together with the impacts foreseen.
- **V&V Design** states how the V&V process builds up including data preparation, execution and evaluation.
- **V&V Methodologies** giving a step-by-step walkthrough of all possible V&V activities including the assumptions, and verdict-relevant limitations and criteria for, e.g., model verification, model-to-code verification, unit testing, integration testing and final validation (according to the standard, this involves running the software on the target hardware).
- **V&V Issues** describing unsolved V&V issues and their impact on the affected proof or verdict.
- **Peer Reviews** going into details on how the community can take part and how official bodies and partners are integrated into the development and review process.

OETCS/WP4/D4.1V00.02 xiv

Test Plan Definition going into the details of testing by describing among other things:

Title as a unique identifier to the test plan.

Description of the test and the test-item giving information about version and revision.

Features to be tested and not to be tested in combination are listed together with information background.

Entry Criteria which have to be met by the EVC before a test can be started, e.g. that the EVC has to be in level 3 limited supervision with the order to switch to level 2.

Suspension criteria and resumption requirements are the central key to a smooth automation of the tests covering topics like when exiting this test before step 10, which entry criteria does it comply to or which resumption sequence has to be executed to continue testing.

Walkthrough covering a step-by-step approach of the test plan.

Environmental requirements going into the details of what is needed concerning the test environment, e.g. tools, adapter, data preparation.

Discrepancy Reports identifying the defects.

Key Participants describing the assignment and task for each role involved.

Accreditation of Participants describing who was accredited to which role during the Verification & Validation phase.

V&V Participants listing the partners participating in V&V activities,

Other participants including other interest groups such as reviewer by affiliate partners¹.

Timeline giving the timeline for the baselines as input to the V&V process and identifying when each artifact should be created.

0.11 Methods and Tools

The project shall select / develop / describe a chain of methods and tools for doing verification & validation in a full development.

In common language, the notion "formal" is often used in a broad sense, meaning everything that can be described by rules, even if they are rather vague. Contrary to that, we use "formal" in the narrow sense of EN-50128 (?, Section D.28), meaning strictly mathematical techniques and methods. Since the Aerospace Standard DO-178C ? follows a similar understanding, but gives more elaborate explanation in its supplementary document devoted to formal methods ?, our presentation closely follows the terminology of the latter.

Formal methods are mathematically based techniques for the specification, development, and verification of software aspects of digital systems. The mathematical basis of formal methods consists of formal logic, discrete mathematics, and computer-readable languages. The use of formal methods is motivated by the expectation that, as in other engineering disciplines, performing appropriate mathematical analyses can contribute to establishing the correctness and robustness of a design.

(?, Section 1.0, p.1)

¹affiliate partners are non-funded companies who signed the project cooperation agreement and with it get read access to the repositories starting from incubation phase to contribute e.g. by reviewing

OETCS/WP4/D4.1V00.02 xv

0.11.1 Characterisation of Formal Methods

Based on rigorous mathematical notions, formal methods may be used to describe software systems' requirements in an unambiguous way, thus supporting precise communication between engineers. Formally specified requirements can be checked for consistency and completeness by appropriate tools; also, compliance between different representation levels of specification can be verified. Formal methods allow one to check software properties like:

- Freedom from exceptions
- Freedom from deadlock
- Non-interference between different levels of criticality
- Worst case resource usage (execution time, stack, ...)
- Correct synchronous or asynchronous behaviour, including absence of unintended behaviour

In order to subsume this variety of applications under a single paradigm, the DO-178C considers a formal method to consist in applying a formal *analysis* to a formal *model*. Both analysis and model differs dependent on the particular method. For most methods, the model is just identical to the source code; however, it may also be e.g. a tool-internally generated abstract state space (used in the Abstract Interpretation method, cf. Section 0.11.2.1 below). For most methods, analysis tools need human advice; however, they may also be fully automatic (e.g. for Model Checking, cf. 0.11.2.3).

0.11.2 Formal Analysis Methods

In this section we present the three most common methods for formal analysis. The foundation of these analysis methods are well understood and they have been applied to many practical problems.

0.11.2.1 Abstract Interpretation

The abstract interpretation method ? builds at every point of a given program a conservative representation of the set of possible states that may occur there during any execution run. It determines particular effects of the program relevant for the properties to be analysed, but does not actually execute it. This allows one to statically determine dynamic properties of infinite-state programs. The main application is to check the absence of runtime errors, like e.g. dereferencing of null-pointers, zero-divides, and out-of-bound array accesses. While conventional ad-hoc static analysis tools such as PCLint or QAC++ are well-tailored for quick, but incomplete analyses, abstract-interpretation based tools require more computation time, but guarantee that *all* runtime errors are detected, due to the conservative approximation of state sets. Human intervention is required to improve the approximation accuracy w.r.t. those program points where *false alarms* have to be removed.

0.11.2.2 Deductive Verification

Deductive methods? ? perform mathematical proofs to establish formally specified properties of a given program, thus providing rigorous evidence. Tools usually extract proof obligations from

²i.e. guaranteeing soundness

OETCS/WP4/D4.1V00.02 xvi

program code and property specifications and attempt to prove them, automated or interactively. Even automated prover tools usually need human assistance, e.g. by providing loop invariants.

0.11.2.3 Model Checking

Model checking ? explores all possible behaviours of a program to determine whether a specified property is satisfied. It is applicable only to programs with reasonable small state spaces; the specifications are usually about temporal properties. If a property is unsatisfied, a counter-example can be generated automatically, showing a use case leading to property violation.

0.11.3 Verification with Formal Methods

In the railway domain, the standard EN 50128 highly recommends use of formal methods in requirements specification ((?, Table A.2)), software architecture (A.3), software design and implementation (A.4), verification and testing (A.5), data preparation (A.11), and modelling (A.17) for Safety Integrity Level SIL 3 and above. However, functional/black-box testing is still mandatory in verification; this constraint may be considered as discouraging from the use of formal methods.

Until recently, the situation was quite similar in the aerospace domain. J. Joyce, a member of the RTCA standardisation committee SC-205, described Airbus' problems in certifying their "unit-proof for unit-test" approach:

"Formal methods were used for certification credit in development of the A380, but apparently it was not a trivial matter to persuade certification authorities that this was acceptable even with the reference to formal methods in DO-178B as an alternative method."

Such experiences eventually caused the more detailed treatment of formal method issues in the revision C of DO-178 that appeared in late 2011. The DO-178C considers formal methods as special cases of reviews and analyses; thus incorporating them without major structural changes of the software development recommendations. For an employed formal method, the standard requires to justify its unambiguity, its soundness³, and any additional assumptions⁴ needed by the method. The DO-178C admits formal property verification on object code as well as on source code, the latter additionally needing evidence about property preservation of the source-to-object code compiler. However, "functional tests executed in target hardware are always required to ensure that the software in the target computer will satisfy the high-level requirements" (?, FM.12.3.5).

As a consequence of subsuming formal methods under general reviews and analyses, no deviating special rules to qualify tools are necessary: "Any tool that supports the formal analysis should be assessed under the tool qualification guidance required by DO-178C and qualified where necessary." (?, FM.1.6.2). Of course, for the railway domain, the rules of EN 50128 for supporting software tools and languages must be taken into account (?, Section 6.7).

³i.e., that the method never asserts a property to be true when it actually may be not true

⁴e.g. data range limits

OETCS/WP4/D4.1V00.02 xvii

0.12 Implementation of Verification & Validation

The verification & validation has to be performed in cooperation with WP 3, which produces DAS2Vs (models and code), and with WP 7, where methods and tools are defined and developed.

To exchange information with WP 3, formats are needed for collecting information about DAS2Vs (V&V tasks) and for giving back information about the results of V&V activities. Similarly, with WP 7 communication shall use formats to describe V&V methods and tools (input from WP 7) and the results of evaluations of V&V methods and tools.

%%Formats, activity organisation%%

Appendix A: Requirements on Verification & Validation

%%Explain the requirement chapter.%%

- Requirements from D2.9.
- Take the lists from the draft from 121207, retain the structure (at least preliminarily).

A.1 Requirements on Verification & Validation from D2.9

%%Adapt the intro text%%

The already provided requirements require a safety plan compliant to the CENELEC EN 50126, 50128 and 50129. This pulls a number of requirements on V&V, including Verification and Validation plans. On the topic of compliance to EN 50128, one shall also refer to the D2.2 document.

R-WP2/D2.6-02-061 A Verification plan shall be issued and complied with.

R-WP2/D2.6-02-061.01 The verification plan shall provide a method to demonstrate the requirements covering all the development artifacts.

R-WP2/D2.6-02-061.02 The verification plan shall state all verification activities required for each of these development artifacts.

R-WP2/D2.6-02-062 A Validation Plan shall be issued and complied with.

R-WP2/D2.6-02-062.01 The validation plan shall provide a method to validate all functional and safety requirements over all development artifacts.

R-WP2/D2.6-02-062.02 The validation plan shall state all validation activities required for each of these development artifacts.

R-WP2/D2.6-01-021 The test plan shall comply the mandatory documents of the SUBSET-076, restricted to the scope of the OpenETCS project.

Justification. It will possibly be difficult to model all the tests in the course of the project, but the test plan should at least be complete.

OETCS/WP4/D4.1V00.02 xx

R-WP2/D2.6-02-063 Each design artifact needs a reference artifact which it implements (*e.g.* code to detailed model, SFM to SSRS model...)

R-WP2/D2.6-02-063.01 The implementation between them relation shall be specified in detail.

e.g. for state machine and a higher level state machine mapping of interfaces, states and transition is required. This includes additional invariants, input assumptions and further restrictions. This information is the basis for verification activities.

R-WP2/D2.6-02-063.02 The design of the artifacts shall be made such to allow verifiability as far as possible.

R-WP2/D2.6-02-064 The findings from the verification shall be traced, and will be adequately addressed (taken into consideration, or postponed or discarded with a justification).

A.2 General Requirements on Verification

Excerpt from EN 50128:2011 [N01]	Requirement	Project Relevance
5.3.2.7	For each document, traceability shall be provided in terms of a unique reference number and a defined and documented relationship with other documents.	fully applicable
5.3.2.8	Each term, acronym or abbreviation shall have the same meaning in every document. If, for historical reasons, this is not possible, the different meanings shall be listed and the references given.	
5.3.2.9	Except for documents relating to pre-existing software (see 7.3.4.7), each document shall be written according to the following rules:	
	 it shall contain or implement all applica- ble conditions and requirements of the preceding document with which it has a hierarchical relationship; 	
	it shall not contradict the preceding doc- ument.	
5.3.2.10	Each item or concept shall be referred to by the same name or description in every document.	
6.5.4.14	Traceability to requirements shall be an important consideration in the validation of a safety-related system and means shall be provided to allow this to be demonstrated throughout all phases of the lifecycle.	

OETCS/WP4/D4.1V00.02 xxi

Excerpt from EN 50128:2011 [N01]	Requirement	Project Relevance
6.5.4.15	Within the context of this European Standard, and to a degree appropriate to the specified software safety integrity level, traceability shall particularly address	
	a) traceability of requirements to the design or other objects which fulfil them,	
	 b) traceability of design objects to the implementation objects which instantiate them. 	
	 c) traceability of requirements and design objects to the tests (component, integra- tion, overall test) and analyses that verify them. 	
	Traceability shall be the subject of configuration management.	
6.5.4.16	In special cases, e.g. pre-existing software or prototyped software, traceability may be established after the implementation and/or documentation of the code, but prior to verification/validation. In these cases, it shall be shown that verification/validation is as effective as it would have been with traceability over all phases.	This requirement does'nt apply to the project.
6.5.4.17	Objects of requirements, design or implementation that cannot be adequately traced shall be demonstrated to have no bearing upon the safety or integrity of the system.	

Excerpt from EN 50128:2011 [N01]	Requirement
6.1.4.1	Tests performed by other parties such as the Requirements Manager, Designer or Implementer, if fully documented and complying with the following requirements, may be accepted by the Verifier.
6.1.4.2	Measurement equipment used for testing shall be calibrated appropriately. Any tools, hardware or software, used for testing shall be shown to be suitable for the purpose.
6.1.4.3	Software testing shall be documented by a Test Specification and a Test Report, as defined in the following.
6.2.4.2	A Software Verification Plan shall be written, under the responsibility of the Verifier, on the basis of the necessary documentation.
6.2.4.3	The Software Verification Plan shall describe the activities to be performed to ensure proper verification and that particular design or other verification needs are suitably provided for
6.2.4.4	During development (and depending upon the size of the system) the plan may be sub- divided into a number of child documents and be added to, as the detailed needs of verification become clearer.
6.2.4.5	The Software Verification Plan shall document all the criteria, techniques and tools to be used in the verification process. The Software Verification Plan shall include techniques and measures chosen from Table A.5, Table A.6, Table A.7 and Table A.8. The selected combination shall be justified as a set satisfying 4.8, 4.9 and 4.10
6.2.4.6	The Software Verification Plan shall describe the activities to be performed to ensure correctness and consistency with respect to the input to that phase. These include reviewing, testing and integration.

OETCS/WP4/D4.1V00.02 xxii

Excerpt from EN 50128:2011 [N01]	Requirement
6.2.4.7	In each development phase it shall be shown that the functional, performance and safety requirements are met.
6.2.4.8	The results of each verification shall be retained in a format defined or referenced in the Software Verification Plan.
6.2.4.9	The Software Verification Plan shall address the following:
	 a) the selection of verification strategies and techniques (to avoid undue complexity in the assessment of the verification and testing, preference shall be given to the selection of techniques which are in themselves readily analysable);
	b) selection of techniques from Table A.5, Table A.6, Table A.7 and Table A.8;
	c) the selection and documentation of verification activities;
	d) the evaluation of verification results gained;
	e) the evaluation of the safety and robustness requirements;
	f) the roles and responsibilities of the personnel involved in the verification process;
	g) the degree of the functional based test coverage required to be achieved;
	h) the structure and content of each verification step, especially for the Software Requirement Verification (7.2.4.22), Software Architecture and Design Verification (7.3.4.41, 7.3.4.42), Software Components Verification (7.4.4.13), Software Source Code Verification (7.5.4.10) and Integration Verification (7.6.4.13) in a way that facilitates review against the Software Verification Plan.
